Conclusion

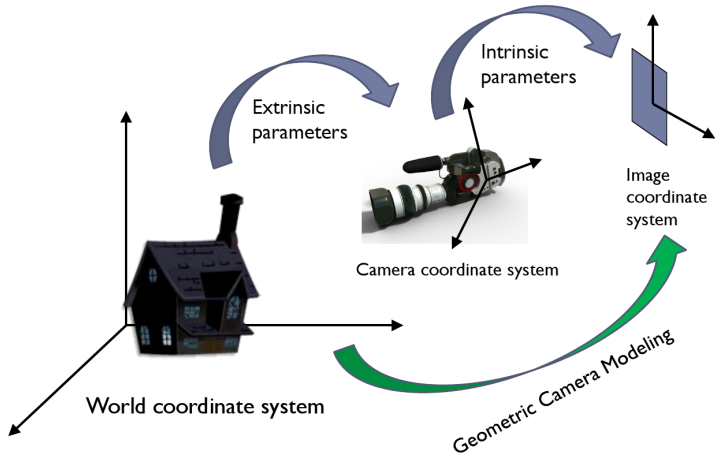

Conclusion

## Objectives

- ① Geometric camera calibration using linear approach
- ② Predict the 2D locations from static and moving 3D points
- ③ Calculate projection matrix **M**
- ④ Using **M** to calculate *intrinsic* and *extrinsic* parameters
- ⑤ For verification visualizing the calibrated images and videos

## Tools, Input & Output

- ① **Python**, PyCharm IDE, Matplotlib, Numpy
- ② **Latex Beamer**, Sublime Text
- ③ **Input** were “model.dat” and “obesrve.dat” files.
- ④ Generated input by program.

**Figure:** Extrinsic parameters are related to world coordinate. i.e. Rotation and Translation. Intrinsic parameters are related to camera coordinate system and hardware properties like pixel size, orientation.

Figure 2.8 Physical and normalized image coordinate systems.

**Figure:** Intrinsic parameters relates the physical image,  $p$ , to a normalized image plane  $\hat{p}$  by solving equations for affine and perspective projection. Parameter  $\alpha, \beta$  are the product of focal length and pixel resolution.  $\theta$  is the angle between horizontal and vertical axis.  $u_0, v_0$  are the center of the physical image. First pinhole coordinate in projected on  $\hat{p}$  using perspective projection.  $\hat{p}$  is projected on  $p$  using affine projection.

$$\mathbf{p} = \begin{pmatrix} u \\ v \\ 1 \end{pmatrix} \Rightarrow \begin{cases} u = \alpha \hat{u} - \alpha \cot \theta \hat{v} + u_0 \\ v = \frac{\beta}{\sin \theta} \hat{v} + v_0 \end{cases}$$

$$\alpha = kf \quad \text{and} \quad \beta = lf$$

$$\hat{\mathbf{p}} = \begin{pmatrix} \hat{u} \\ \hat{v} \\ 1 \end{pmatrix} = \frac{1}{z} (\mathbf{I} \quad \mathbf{0}) \mathbf{P}$$

(3D to 2D perspective projection  
on the normalized image plane)

Converting the coordinates in homogeneous for makes these equation computationally suitable for optimization. All the intrinsic parameters can be encoded into a matrix K.

Conclusion

Conclusion

$$\mathbf{K} = \begin{pmatrix} \alpha & -\alpha \cot \theta & u_0 \\ 0 & \frac{\beta}{\sin \theta} & v_0 \\ 0 & 0 & 1 \end{pmatrix}$$

All the intrinsic parameters are encoded in the projection matrix  $\mathbf{K}$ . ( $\hat{\mathbf{p}}$ 's projection on  $\mathbf{p}$ ).

$$\mathbf{p} = \mathbf{K} \hat{\mathbf{p}}$$

Can rewritten as,

$$\mathbf{p} = \mathbf{K} \frac{1}{z} (\mathbf{I} \quad 0) \mathbf{P}$$

$$\mathbf{p} = \frac{1}{z} \mathbf{M} \mathbf{P}$$

Conclusion

Conclusion

$z$  is not independent of  $M$  and  $P$ . Thus

$$M = \begin{pmatrix} \mathbf{m}_1^T \\ \mathbf{m}_2^T \\ \mathbf{m}_3^T \end{pmatrix}$$

$$\begin{pmatrix} u \\ v \\ 1 \end{pmatrix} = \frac{1}{z} \begin{pmatrix} \mathbf{m}_1^T \mathbf{P} \\ \mathbf{m}_2^T \mathbf{P} \\ \mathbf{m}_3^T \mathbf{P} \end{pmatrix} = \frac{1}{z} \begin{pmatrix} \mathbf{m}_1 \cdot \mathbf{P} \\ \mathbf{m}_2 \cdot \mathbf{P} \\ \mathbf{m}_3 \cdot \mathbf{P} \end{pmatrix} \Rightarrow \begin{cases} z = \mathbf{m}_3 \cdot \mathbf{P} \\ u = \frac{\mathbf{m}_1 \cdot \mathbf{P}}{\mathbf{m}_3 \cdot \mathbf{P}} \\ v = \frac{\mathbf{m}_2 \cdot \mathbf{P}}{\mathbf{m}_3 \cdot \mathbf{P}} \end{cases}$$

Estimation of  
Parameters

Result

Conclusion

Conclusion

For  $n$  given World coordinates the parameter can be solved using the following linear system

$$\mathbf{Q}\mathbf{m} = 0 \quad \longrightarrow \quad \hat{\mathbf{m}} = \arg \min_{\mathbf{m}} |\mathbf{Q}\mathbf{m}|^2$$

$$\mathbf{Q} = \begin{pmatrix} \mathbf{P}_1^T & \mathbf{0}^T & -u_1\mathbf{P}_1^T \\ \mathbf{0}^T & \mathbf{P}_1^T & -v_1\mathbf{P}_1^T \\ \dots & \dots & \dots \\ \mathbf{P}_n^T & \mathbf{0}^T & -u_n\mathbf{P}_n^T \\ \mathbf{0}^T & \mathbf{P}_n^T & -v_n\mathbf{P}_n^T \end{pmatrix}_{2n \times 12} \quad \text{and} \quad \mathbf{m} = \begin{pmatrix} \mathbf{m}_1 \\ \mathbf{m}_2 \\ \mathbf{m}_3 \end{pmatrix}_{12 \times 1}$$

In the project the “model.dat” & “observe.dat” file contained all information to build  $\mathbf{P}$  and  $u, v$  respectively to calculate  $\mathbf{Q}$ .

The first task was to estimate projection matrix  $\mathbf{M}$ . Other tasks involved manipulating  $\mathbf{M}$  to calculate extrinsic and intrinsic parameters and 2D locations of given 3D locations.

Parameters

Result

Conclusion

Conclusion

When projection matrix  $M$  is calculated it can be divided into blocks

$$\mathbf{M} = \begin{pmatrix} \mathbf{A} & \mathbf{b} \end{pmatrix}$$

Using a scaling factor  $\rho$  we can define

$$\rho \begin{pmatrix} \mathbf{A} & \mathbf{b} \end{pmatrix} = \mathbf{K} \begin{pmatrix} \mathbf{R} & \mathbf{t} \end{pmatrix} = \begin{pmatrix} \mathbf{K} \mathbf{R} & \mathbf{K} \mathbf{t} \end{pmatrix}$$

Intrinsic Parameters

Extrinsic Parameters

Basic Theory

Estimation of  
Parameters

Result

Conclusion

Conclusion

Intrinsic parameters can be calculated using the constraint that  $\rho a_3$  is always  $\pm 1$  because rows of a rotation matrix is has unit length

$$\rho = \varepsilon / |\mathbf{a}_3|$$

$$u_0 = \rho^2 (\mathbf{a}_1 \cdot \mathbf{a}_3)$$

$$v_0 = \rho^2 (\mathbf{a}_2 \cdot \mathbf{a}_3)$$

$$\cos \theta = - \frac{(\mathbf{a}_1 \times \mathbf{a}_3) \cdot (\mathbf{a}_2 \times \mathbf{a}_3)}{|\mathbf{a}_1 \times \mathbf{a}_3| |\mathbf{a}_2 \times \mathbf{a}_3|}$$

$$\alpha = \rho^2 |\mathbf{a}_1 \times \mathbf{a}_3| \sin \theta$$

$$\beta = \rho^2 |\mathbf{a}_2 \times \mathbf{a}_3| \sin \theta$$

Intrinsic Parameters

Extrinsic Parameters

Basic Theory

Estimation of  
Parameters

Result

Conclusion

Conclusion

Extrinsic parameters can be calculated using

$$\mathbf{r}_1 = \frac{1}{|\mathbf{a}_2 \times \mathbf{a}_3|} (\mathbf{a}_2 \times \mathbf{a}_3)$$

$$\mathbf{r}_3 = \rho \mathbf{a}_3$$

$$\mathbf{r}_2 = \mathbf{r}_3 \times \mathbf{r}_1$$

Where the key term is to calculate  $r_3$  having calculated  $\rho$ . The cross products follow that right hand rule.

$$\mathbf{t} = \begin{pmatrix} t_x \\ t_y \\ t_z \end{pmatrix} = \rho \mathbf{K}^{-1} \mathbf{b}$$

**Figure:** Plot of input data in model file using window size 4. The plot shows the input matches with the projection. It implies two things; the input data and the calculated projection matrix both are correct. The same window size has been used throughout the project. Here window size is the number of pixel which has been blacken out to draw a dot.

Conclusion

Conclusion

- We were give 27 world coordinates and image pixel coordinate in input
- I have manually added (5, 10, 0), (10, 5, 0) in model and corresponding pixel (171, 250), (465, 251) in observation using Gimp Image editor and then run the program.
- I have found that adding more observation increases the accuracy of projection
- I have defined the accuracy as the difference between the projected 2D observation and actual observation

$$E = \frac{\|A - B\|}{N}. \text{ Where } N \text{ is the number of observation.}$$

**Table:** Effect of Changing Parameters

N	E	theta (in deg)
27	0.097990	85.027358
28	0.094491	85.033215
29	0.091232	91.722549
